Release Summary

KeyedIn Enterprise's v8.02, is a scheduled maintenance update release with general support fixes and some enhancements to Column Chooser selections and API operations.

Column Chooser Enhancement

With this enhancement, additional fields are available for display or filtering on the **Project, Task, and Assignment** system widgets as well as in the Search column choosers. This option is in addition to the Configuration |Display Settings | Search Screens settings where administrators may select to Show Codes or Show Names. This provides a way for users to search or filter on one value while displaying another.

Column chooser options now include:

- Project Code
- Project Name
- Client Code
- Client Name

Note: Client and Project both have options in Configuration |Screen Labels to change their default value and may be named different in your system.

Enterprise API Enhancement

This enhancement is intended to improve the performance of API calls and reduce timeouts that may occur because of recalculating project measures. A parameter called RecalculateMeasures (Boolean) will be specified on the POST, PATCH, and DELETE calls to indicate if the Project measures should be recalculated at time of update or at next Scheduled Job | Update Project Measures.

This applies to API calls for:

- Projects – Post / Patch / Delete
- Actions – Post / Patch / Delete
- Deliverables – Post / Patch
